技术规格

Background:	The protein encoded by BAD gene is a member of the BCL-2 family. BCL-2 family members are known to be re gulators of programmed cell death. This protein positivel y regulates cell apoptosis by forming heterodimers with BCL-xL and BCL-2, and reversing their death repressor ac tivity. Proapoptotic activity of this protein is regulated th rough its phosphorylation. Protein kinases AKT and MAP kinase, as well as protein phosphatase calcineurin were f ound to be involved in the regulation of this protein. Alt ernative splicing of this gene results in two transcript va riants which encode the same isoform.
