

大鼠 IgG(H+L)

中文名称: 大鼠 IgG (H+L)

英文名称: Rat IgG (H+L)

相关类别: IgG

储 存: 冷冻(-20℃) 避光

技术规格

Background	Immunoglobulin G (IgG) is one of the most abundant protein s in serum with normal levels between 8-17 mg/mL in adult blood. IgG is important for our defense against microorganis ms and the molecules are produced by B lymphocytes as a p art of our adaptive immune response. The IgG molecule has t wo separate functions, to bind to the pathogen that elicited t he response and to recruit other cells and molecules to destr oy the antigen. The variability of the IgG pool is generated b y somatic recombination and the number of specificities in an individual at a given time point is estimated to be 1011 varia nts.
Applications	Optimal tested applications and working dilutions must be de termined by the end user.
