技术规格

Background:	This gene encodes a member of the galanin family of neuropeptides. The encoded protein binds galanin receptors 1, 2 and 3 with the highest affinity for galanin receptor 3 and has been implicated in biological processes involving the central nervous system including hypothalamic regulation of metabolism and reproduction. A peptide encoded by a splice variant of this gene, termed alar in, has vasoactive properties, displays antimicrobial activity against E. coli, and may serve as a marker for neuroblastoma tumors.
