技术规格

Background:	The galectins are a family of beta-galactoside-binding proteins implicated in modulating cell-cell and cell-matrix interactions. T his gene product may act as an autocrine negative growth fact or that regulates cell proliferation. May regulate apoptosis, cell proliferation and cell differentiation. Binds beta-galactoside and a wide array of complex carbohydrates. Inhibits CD45 protein p hosphatase activity and therefore the dephosphorylation of Lyn kinase.
