Background:	This gene encodes a member of the 2-5A synthetase family, ess ential proteins involved in the innate immune response to viral i nfection. The encoded protein is induced by interferons and use s adenosine triphosphate in 2'-specific nucleotidyl transfer reacti ons to synthesize 2',5'-oligoadenylates (2-5As). These molecules activate latent RNase L, which results in viral RNA degradation a nd the inhibition of viral replication. The three known members of this gene family are located in a cluster on chromosome 12. Alternatively spliced transcript variants encoding different isofor ms have been described.
