概述

Synthetic peptide corresponding to a region derived from 433-447 amino acids of human progesterone receptor

技术规格

Full name:	Progesterone receptor
Synonyms:	PR, NR3C3
Gene Accession:	NP_001258090
SwissProt:	P06401
Background:	This gene encodes a member of the steroid receptor superfamily. The encoded protein mediates the physiological effects of progesterone, which plays a central role in reproductive events associated with the establishment and maintenance of pregnancy. This gene uses two distinct promoters and translation start sites in the first exon to produce two isoforms, A and B. The two isoforms are identical except for the additional 165 amino acids found in the N-terminus of isoform B and mediate their own response genes and physiologic effects with little overlap.
