技术规格

Background:	This gene encodes a transcription factor that contains both basic helix-loop-helix and leucine zipper structural features. It regulates the differentiation and development of melanocytes retinal pigment epithelium and is also responsible for pigment cell-specific transcription of the melanogenesis enzyme genes. Heterozygous mutations in the this gene cause auditory-pigmentary syndromes, such as Waardenburg syndrome type 2 and Tietz syndrome.
Applications:	WB, IHC, IF
Name of antibody:	MITF(Ab-180/73)
Immunogen:	Synthesized non-phosphopeptide derived from human MITF around the phosphorylation site of serine 180/73 (P-N-S(p)-P-M).

Full name:	microphthalmia-associated transcription factor

IHC positive control:	Human skin tissue
IHC Recommend dilution:	50-100
WB Predicted band size:	59 kDa
WB Positive control:	HepG2 cells and COLO205 lysates
