技术规格

Background:	The muscle acetylcholine receptor is composed of five subunits: two alpha subunits and one beta, one gamma, and one delta subunit. This gene encodes the beta subunit of the acetylcholine receptor. The acetylcholine receptor changes conformation upon acetylcholine binding leading to the opening of an ion-conducting channel across the plasma membrane. Mutations in this gene are associated with slow-channel congenital myasthenic syndrome.
Applications:	WB
Name of antibody:	CHRNB1
Immunogen:	Synthesized peptide derived from N-terminal of human CHRNB1.
Full name:	cholinergic receptor, nicotinic, beta 1 (muscle)

SwissProt:	P11230
WB Predicted band size:	57 kDa
WB Positive control:	Hela cells lysate
