## 技术规格

**Background:** 

This gene encodes a member of the sorting nexin fa mily. Members of this family contain a phox (PX) do main, which is a phosphoinositide binding domain, a nd are involved in intracellular trafficking. This protein associates with the long isoform of the leptin receptor, the transforming growth factor-beta family of receptor serine-threonine kinases, and with receptor ty rosine kinases for platelet-derived growth factor, insulin, and epidermal growth factor. This protein may for moligomeric complexes with family member proteins through interactions of both the PX domain and the

	coiled coil regions of the molecules. Translocation of this protein from the cytoplasm to the nucleus occur s after binding to proviral integration site 1 protein. This gene results in two transcripts encoding two dis tinct isoforms.
