技术规格

Background:

This gene encodes a member of the cytochrome P450 su perfamily of enzymes. The cytochrome P450 proteins are monooxygenases which catalyze many reactions involved in drug metabolism and synthesis of cholesterol, steroids and other lipids. However, this protein is considered a m ember of the cytochrome P450 superfamily on the basis of sequence similarity rather than functional similarity. Th is endoplasmic reticulum membrane protein catalyzes the conversion of prostglandin H2 to thromboxane A2, a pot ent vasoconstrictor and inducer of platelet aggregation. The enzyme plays a role in several pathophysiological pro

	cesses including hemostasis, cardiovascular disease, and s troke. Alternatively spliced transcript variants encoding di fferent isoforms have been found for this gene.
